Encrypt Your Emails

Encryption Is Important

Email is **not private or secure** by default. All emails are open to **multiple points of observation** between sender and receiver. This **leaves the door open** to identity theft, hacking, and loss of secrets.

Sensitive information such as bank logins, bank statements, private messages, 2-factor authentication, and government documentation are routinely sent via email.

To keep communications private and confidential and to protect personal information against data theft or malicious hackers, **encrypt your emails!**

It's **easy and free to use encryption** in your email application. With just a few steps you can create your own encryption keys, and set your email application to automatically use encryption.

Easy steps

1. Create your own public/private key files at https://pgptool.org/
2. Set your email program to use your public/private key files.

More information at https://www.openpgp.org/software/
